```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

UI-E-EO1 is a normalized cDNA library containing the UI-E-EO1 is a normalized cDNA library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand CDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an ECOR I adaptor, dispested with Not I, and cloned directionally into pT773-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CGCGTMARCC. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI).

Clones are derived from the mouse BAC library RPCI-23. For BAC
library availability, please contact Pieter de Jong
(pieter@dejong.med.buffalo.edu). Clones may be purchased from
BACPAC Resources (http://bacpac.med.buffalo.edu/orderingframe.htm)
or from Resea ch Genetics (info@resgon.com). BAC end page:
http://www.iigr.org/tdb/bac_ends/mouse/bac_end_intro.html
Plate: 316 row: A column: 10
Seq primer: T7
Class: BAC ends.

ECORI; Site 2: ECORI; Female C57BL/6J mouse kidney and/or brain genomic DNA was isolated and partially digested with a combination of ECORI and ECORI Methylase. Size selected DNA was cloned into the pBACG3.6 vector at the ECORI sites. The ligation products were transformed into DH10B electrocompetent cells (BRL Life Technologies). "

Brain genomic DNA was isolated and partially digested
with a combination of EcoR1 and EcoR1 Methylase. Size
selected DNA was cloned into the pBACe3.6 vector at the
ECOR1 sites. The ligation products were transformed into
DH10B electrocompetent cells (BRL Life Technologies). "

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Description

                                                                                                                                                                                                                                                                  à
                                         The present sequence represents a nucleic acid sequence that is used as a reference sequence to exemplify the method of the invention. The specification describes a method for the biological preparation of a stably encapsulated reference nucleic acid for molecular diagnostic and genetic testing. The method comprises inserting a vector containing a reference nucleic acid into a cell through its lipoprotein outer membrane to encapsulate the nucleic acid, multiplying the cell to propagate the nucleic acid, multiplying the cell to propagate the and achieving a desired stability of the cell membrane for substantially matching the nucleic acid with the membrane stability of test cells. The reference nucleic acid with the membrane stability of test cells. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

It is also useful as a metal callediation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replace therapy for individuals having a defective human hemochromatosis ge

(I) is useful for reducing intracellular iron absorption in patients having hereditary haemochromatosis, transfusions,

thalassaemias, haemolytic anaemia or chronic infections, and for delivering a therapeutic to cells that over-express transferrin receptor (TFR) which are preferably lymphocytes or leukocytes, across the bloodcomain barrier. (I) is further useful for treating brain tumour. (I) is also useful for treating oxidative stress disorders resulting in tissue damage e.g. vascular diseases, inflammation, atherosclerosis, lung injury, ischaemia, etc. A DNA molecule (II) encoding (I) is useful as a platform for drug delivery of therapeutic use for cancer, autoimmune diseases and inflammatory conditions. The monochain manifests specific characteristics advantageous for drug delivery systems. It is a coluble, stable and fully conformed protein. It binds specifically to transferrin receptor (TFR) and therefore targets cells that over-express this receptor. It is continuously internalised by the target cells, thus cells, minimising side effects. It dissociates from the receptor in the cells, minimising side effects. It megatively regulares iron absorption, reducing growth of undesired cells and preventing lymphocyte activation. It is not diluted in the blood as is transferrin. It should not induce an immune response since it is a self non-polymeric protein and delivery of drugs via monochain is expected to overcome drug-resistance since it is a continuous of heterometric represents the continuous of heterometric represents the

                                                                                                                                                                                                                                                                                                                                                                                    This Caby Clone, designated current in the Trom in man gene whose mutated form is associated with hereditary haemochromatosis whose mutated form is associated with hereditary haemochromatosis (HH). It was obtained from a directionally cloned plasmid-based corn library following identification of the HH locus in the HLA region of chromosome 6. A single mutation (24d1) in the HH gene appears responsible for the majority of HH disease. This comprises chromosomes and in 4% to unaffected chromosomes. It results in a cys to Tyr substitution in the encoded protein (see AAW36499) at a cys to Tyr substitution in the encoded protein (see AAW36499) at a cys to Tyr substitution in the encoded protein (see AAW36499) at a cys to Tyr substitution in the encoded protein (see AAW36499) at a cys to Tyr substitution in the encoded protein (see AAW36499) at a cys to Tyr substitution in the encoded protein (Bee AAW36499) at a cys to Tyr substitution in the encoded protein (Bee AAW36499) at a cys to Tyr substitution in the HH gene product, its variants (24d1, 24d2 and 24d7), or a peptide of at least 56 amino acid residues of these; an antibody produced using the peptide; a method testion an animal model for the HH disease; metal common HH gene mutation; an animal model for the HH disease; in vivo or mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process in vivo or mitigation of injury due to oxidative process on vivo or mitigation of injury due to oxidative process on vivo or mitigation of injury due to oxidative process on vivo or mitigation of injury due to oxidative process on vivo or mitigation of injury due to oxidation with HH disease; an antisense oligonucleotide directed against a transcriptional therapeutic agents for activity in commercion with HH disease; an antisense oligonucleotide directed against a transcriptional cor pairs of oligonucleotide sof the HH disea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 AACATCACCATGAAGTGGCTGAAGGATAAGCAGCCAATGGATGCCAAGGAGGTTCGAACCT
